

EMERGENCY BRIDGING KEY

ENHANCING OPERATIONAL SAFETY

THINK SAFE. WORK SAFE. HOME SAFE.

The Terex Zero Harm principles not only apply to Franna team members, but also to customers and operators alike. The Franna emergency bridging key provides an additional layer of safety that compliments the existing safety features of each crane.

The emergency bridging key has been designed to maintain operational flexibility, while providing an additional safety interlock. Site safety is enhanced through the provision of a removable key which can be held by authorised site personnel, providing greater control of site lifting practices.

THE EMERGENCY BRIDGING KEY PROVIDES:

- ▶ Visual and audible warnings
- ▶ A removable external key as a provision for overriding operational failure
- ▶ Minimised speed of crane movements while activated

The emergency bridging key feature is available for new Franna AT 40 & MAC 25-4 cranes or as retrofit to any MAC 25's with existing Dynamic LMI in place.
